# What is software architecture?

# Structure

The definition of software in terms
of its building blocks and their interactions

# Vision

The process of architecting;
making decisions based upon business goals,
requirements and constraints,
plus being able to communicate this to a team

# Enterprise Architecture

Structure and strategy across people, process and technology

## System Architecture

High-level structure of a software system
(software and infrastructure)

## Application Architecture

The internal structure of an application

As a noun, **design is the named structure** or behaviour of a system whose presence resolves … a force on that system. A design thus represents one point in a potential decision space.

Grady Booch

All architecture is design, but
**not all design is architecture**.

Grady Booch

Architecture represents the **significant decisions**, where significance is measured by **cost of change**.

Grady Booch

**Draw** one or more software architecture diagrams to describe the system/project you are currently working on

**60 minutes**

**Design** a software solution for the ”Financial Risk System”, and **draw** one or more architecture diagrams to describe your solution

**90 minutes**

Did you find anything about this exercise **challenging**?

## Challenging?

Level of detail
- where to stop

Who is the audience / different backgrounds

Implementation
- easy to get bogged down in detail

Type of diagrams

Notation

Documenting assumptions

## (10) Challenging?

Verifying our own assumptions

Expressing the solution
- communicating it in a clear way
- use of notation
- easy to mix levels of abstraction
- how much detail?

## (7) Challenging

Needed to ask questions / make assumptions

Temptation to focus on detail
- when do we stop?

How much detail?

Talked about more than the diagrams

What notation?
- boxes
- arrows

# **Swap** and **review** your diagrams

Focus on the diagrams rather than the solution itself;
do you understand the notation, colour coding, symbols, etc?

**15 minutes**

# The perfection game

We rate the diagrams... (1-10)

We liked...

To make the diagrams perfect...

**15 minutes**

**good communication**

I've run diagramming workshops

in **30+ countries**

for **10,000+ people**

Software architects

**struggle to communicate**

software architecture

Do **you** use UML?

In my experience, optimistically,

# 1 out of 10 people use UML

Who are the **stakeholders** that you need to communicate software architecture to; what **information** do they need?

There are many **different audiences** for diagrams and documentation, all with **different interests**

(software architects, software developers, operations and support staff, testers, Product Owners, project managers, Scrum Masters, users, management, business sponsors, potential customers, potential investors, ...)

The primary use for diagrams and documentation is **communication** and **learning**

Software architecture diagrams, when connected to the code, are also a fantastic tool for **architectural improvement**

To describe a software architecture, we use a model composed of multiple views or perspectives.

Architectural Blueprints - The “4+1” View Model of Software Architecture

Philippe Kruchten

The description of an architecture—the decisions made—can be organized around these four views, and then illustrated by a few selected *use cases*, or *scenarios* which become a fifth view. The architecture is in fact partially evolved from these scenarios as we will see later.

Figure 1 — The "4+1" view model

# “Viewpoints and Perspectives”

Why is there a separation between the **logical** and **development** views?

“Our architecture diagrams don’t match the code.”

**Model-code gap.** Your architecture models and your source code will not show the same things. The difference between them is the *model-code gap*. Your architecture models include some abstract concepts, like components, that your programming language does not, but could. Beyond that, architecture models include intensional elements, like design decisions and constraints, that cannot be expressed in procedural source code at all.

Consequently, the relationship between the architecture model and source code is complicated. It is mostly a refinement relationship, where the extensional elements in the architecture model are refined into extensional elements in source code. This is shown in Figure 10.3. However, intensional elements are not refined into corresponding elements in source code.

Upon learning about the model-code gap, your first instinct may be to avoid it. But reflecting on the origins of the gap gives little hope of a general solution in the short term: architecture models help you reason about complexity and scale because they are abstract and intensional; source code executes on machines because it is concrete and extensional.

# “model-code gap”

# Software Reflexion Models: Bridging the Gap between Source and High-Level Models*

## Abstract

Software engineers often use high-level models (for instance, box and arrow sketches) to reason and communicate about an existing software system. One problem with high-level models is that they are almost always inaccurate with respect to the system's source code. We have developed an approach that helps an engineer use a high-level model of the structure of an existing software system as a lens through which to see a model of that system's source code. In particular, an engineer defines a high-level model and specifies how the model maps to the source. A tool then computes a software reflexion model that shows where the engineer's high-level model agrees with and where it differs from a model of the source.

The paper provides a formal characterization of reflexion models, discusses practical aspects of the approach, and relates experiences of applying the approach and tools to a number of different systems. The illustrative example used in the paper describes the application of reflexion models to NetBSD, an implementation of Unix comprised of 250,000 lines of C code. In only a few hours, an engineer computed several reflexion models that provided him with a useful, global overview of the structure of the NetBSD virtual memory subsystem. The approach has also been applied to aid in the understanding and experimental reengineering of the Microsoft Excel spreadsheet product.

*This research was funded in part by the NSF grant CCR-8858804 and a Canadian NSERC post-graduate scholarship.

## 1 Introduction

Software engineers often think about an existing software system in terms of high-level models. Box and arrow sketches of a system, for instance, are often found on engineers' whiteboards. Although these models are commonly used, reasoning about the system in terms of such models can be dangerous because the models are almost always inaccurate with respect to the system's source.

Current reverse engineering systems derive high-level models from the source code. These derived models are useful because they are, by their very nature, accurate representations of the source. Although accurate, the models created by these reverse engineering systems may differ from the models sketched by engineers; an example of this is reported by Wong et al. [WTMS95].

We have developed an approach, illustrated in Figure 1, that enables an engineer to produce sufficiently accurate high-level models in a different way. The engineer defines a high-level model of interest, extracts a source model (such as a call graph or an inheritance hierarchy) from the source code, and defines a declarative mapping between the two models. A *software reflexion model* is then computed to determine where the engineer's high-level model does and does not agree with the source model.[1] An engineer interprets the reflexion model and, as necessary, modifies the input to iteratively compute additional reflexion models.

[1]The old English spelling differentiates our use of "reflexion" from the field of reflective computing [Smi84].

# 1 Introduction

Software engineers often think about an existing software system in terms of high-level models. Box and arrow sketches of a system, for instance, are often found on engineers' whiteboards. Although these models are commonly used, reasoning about the system in terms of such models can be dangerous because the models are almost always inaccurate with respect to the system's source.

Current reverse engineering systems derive high-level models from the source code. These derived models are useful because they are, by their very nature, accurate representations of the source. Although accurate, the models created by these reverse engineering systems may differ from the models sketched by engineers; an example of this is reported by Wong et al. [WTMS95].

We lack a **common vocabulary** to describe software architecture

# 1 component

*noun* | com·po·nent | \kəm-ˈpō-nənt, ˈkäm-ˌ, käm-ˈ\

## Simple Definition of COMPONENT

Popularity: Top 30% of words

: one of the parts of something (such as a system or mixture) : an important piece of something

Source: Merriam-Webster's Learner's Dictionary

# Ubiquitous language

# Abstractions

# Would you code it that way?

(ensure that your diagrams reflect your implementation intent)

When drawing software architecture diagrams, think like a software developer

A **common set of abstractions**
is more important
than a common notation

A **software system** is made up of one or more **containers**, each of which contains one or more **components**, which in turn are implemented by one or more **code elements**.

# Static structure diagrams

# C4

c4model.com

## 1. System Context

The system plus users and system dependencies.

## 2. Containers

The overall shape of the architecture and technology choices.

## 3. Components

Logical components and their interactions within a container.

## 4. Classes (or Code)

Component implementation details.

Overview first

Zoom & filter

Details on demand

[System Context] techtribes.je

[Containers] techtribes.je

[Components] techtribes.je - Content Updater

# Diagrams are maps

that help software developers navigate a large and/or complex codebase

A model of the **static structure** forms the basis for other views

# Example

(techtribes.je)

# techtribes.je

A simple content aggregator for the local tech and digital industry

[System Context] techtribes.je

[Containers] techtribes.je

* Used by all components

[Components] techtribes.je - Content Updater

«interface»
+ TweetComponent
# TweetComponentImpl
«throws»
+ TweetException
«uses»
# MongoDbTweetDao
je.techtribes.component.tweet

# Notation

# Titles

Short and meaningful, include the **diagram type**, numbered if diagram order is important; for example:

**System Context diagram** for Financial Risk System

[**System Context**] Financial Risk System

# Layout

Sticky notes and index cards (e.g. CRC cards) make a great substitute for hand-drawn boxes, especially if you don’t have a whiteboard

# Orientation

Most important thing in the middle;
try to be consistent across diagrams

# Acronyms

Be wary of using acronyms, especially those related to the business/domain that you work in

# Elements

Start with simple boxes containing the element name, type, technology (if appropriate) and a description/responsibilities

## Anonymous User

[Person]

Anybody on the web.

## techtribes.je

[Software System]

techtribes.je is the only way to keep up to date with the IT, tech and digital sector in Jersey and Guernsey, Channel Islands.

## Web Application

[Container: Java + Spring MVC]

Allows users to view people, tribes, content, events, jobs, etc from the local tech, digital and IT sector.

## Twitter Connector

[Component: Spring Bean + Twitter4j]

Retrieves profile information and tweets (using the REST and Streaming APIs).

[Containers] techtribes.je

[Containers] techtribes.je

# Lines

Favour uni-directional lines showing the most important dependencies or data flow, with an annotation to be explicit about the purpose of the line and direction

# Dependency vs data flow

# Read the relationship out loud

# Key/legend

Explain shapes, line styles, colours, borders, acronyms, etc

... even if your notation seems obvious!

Use shape, colour and size to **complement** a diagram that already makes sense

**Container diagram for techtribes.je**

Friday 12 May 2017 10:42 UTC

**Container diagram for techtribes.je**

Monday 27 February 2017 09:39 UTC

Increase the **readability** of software architecture diagrams, so they can **stand alone**

Any narrative should **complement** the diagram rather than explain it

# Draw a Component diagram to describe a container

(components within the container in scope)

**30 minutes**

Designing software is where the complexity should be, not communicating it!

Richer diagrams lead to richer **design discussions**

# The perfection game

We rate the diagrams... (1-10)

We liked...

To make the diagrams perfect...

**15 minutes**

Similar levels of abstraction provide a way to easily **compare** solutions

# C4 and UML

# Spring PetClinic

A sample application that illustrates how to build Java web applications using the Spring MVC framework

Audit Store

Use dynamic diagrams to describe **patterns** or **complex interactions**

# Deployment diagrams

**Deployment** is about the mapping of containers to infrastructure

# Deployment Node

Physical infrastructure (a physical server or device), virtualised infrastructure (IaaS, PaaS, a virtual machine), containerised infrastructure (a Docker container), database server, Java EE web/application server, Microsoft IIS, etc

A deployment node can contain other **deployment nodes** or **container instances**

# Structurizr Express

Welcome to Structurizr Express, a tool to help you quickly create a single System Landscape, System Context, Container or Component diagram from the C4 model by defining it as text. See the help page for more information.

If you would like to create a full software architecture model with multiple diagrams, take a look at the Structurizr client libraries for Java and .NET instead.

Static analysis and dependency management tools can help **understand code structure**

Structure101, Lattix, JArchitect, NDepend, JDepend, jQAssistant, Degraph, ...

Richness of model
Modelling tools
Sophisticated and often complex tooling to create rich models using UML, ArchiMate, SysML, etc; either by “drag & drop” or reverse-engineering code.
Static analysis tools
Often complex to setup; creates a model based upon code only; designed for understanding code rather than communicating software architecture.
Text-based tools
Very quick and easy to use; text can be version controlled; designed to create individual diagrams rather than models.
General purpose tools
Easy to use; very flexible; unstructured; no underlying model.
Whiteboard
Create diagrams easily; usually transient.
Ease of use

## What do you see as the future of software architecture documentation?

**Eoin**: I hope that in the future we'll need very little software architecture documentation because we'll be able to see the architecture in the code and the running system! One of the reasons we need much of our architecture documentation today is because there's no way of representing architectural structures directly using the technologies we have at our disposal. I'd love to see our architectural constructs as first class implementation structures and then architecture documentation can evolve to capture decisions, rationale and analysis, rather than just capturing structures. On the way to this nirvana, I hope that work going on in the areas of DSLs and ADLs (architecture description languages) point the more immediate way forward, as we improve our description languages, on the way to working out how to embed the information right in the running system.

**Paulo**: The software architecture discipline is fairly new. There is a long path ahead until we get to a point where an architect creates architecture documentation that is readily understood by a developer who has never worked with that architect. The way to get there is to let new architects learn software architecture at school rather than try-and-error in the battlefield. This education includes proper ways to represent the software architecture for other people's consumption. Important initiatives in the direction of good software architecture education are: the work of Grady Booch on the handbook of software architecture and the publications and curriculum developed at the SEI.

**Grady**: There is a lot of energy being applied today with regard to architectural frameworks and methods: TOGAF, NEA, DoDAF, MoDAF, FSAM, Zachman, and so on. The good news is that there is a vibrant dialog going on with regard to these frameworks and methods - but I expect there will be a shakeout/simplification over time.

**Len**: The ideal development environment is one for which the documentation is available for essentially free with the push of a button. This will require an integrated development, requirements management, and project management environment. Although this will be a long time coming, it provides a worthy goal to strive for.

**Component diagram for Spring PetClinic - Web Application**

The Components diagram for the Spring PetClinic web application.
Friday 18 November 2016 22:21 UTC

Most tools see code,
not **components**

Information about software architecture doesn’t exist in the code

**Model-code gap.** Your architecture models and your source code will not show the same things. The difference between them is the *model-code gap*. Your architecture models include some abstract concepts, like components, that your programming language does not, but could. Beyond that, architecture models include intensional elements, like design decisions and constraints, that cannot be expressed in procedural source code at all.

Consequently, the relationship between the architecture model and source code is complicated. It is mostly a refinement relationship, where the extensional elements in the architecture model are refined into extensional elements in source code. This is shown in Figure 10.3. However, intensional elements are not refined into corresponding elements in source code.

Upon learning about the model-code gap, your first instinct may be to avoid it. But reflecting on the origins of the gap gives little hope of a general solution in the short term: architecture models help you reason about complexity and scale because they are abstract and intensional; source code executes on machines because it is concrete and extensional.

# “architecturally-evident coding style”

# Examples of architecturally-evident coding styles

Annotations/attributes (@Component, [Component], etc)

Naming conventions (*Service)

Namespacing/packaging (com.mycompany.system.components.*)

Maven & Gradle modules, OSGi & Java 9 modules

JavaScript module patterns, ECMAScript 6 modules, microservices, etc

**Extract** as much of the software architecture from the code as possible, and **supplement** the model where necessary

# **Executable** architecture description language

Structurizr for Java and .NET

Richness of model

## Modelling tools

Sophisticated and often complex tooling to create rich models using UML, ArchiMate, SysML, etc; either by “drag & drop” or reverse-engineering code.

## Static analysis tools

Often complex to setup; creates a model based upon code only; designed for understanding code rather than communicating software architecture.

Structurizr

Visualise, document and explore your software architecture

Creates a relatively rich yet simple model, in a developer-friendly way using Java/C# code, supplemented with Markdown/AsciiDoc documentation.

## Text-based tools

Very quick and easy to use; text can be version controlled; designed to create individual diagrams rather than models.

## General purpose tools

Easy to use; very flexible; unstructured; no underlying model.

## Whiteboard

Create diagrams easily; usually transient.

Ease of use

```
public static void main(String[] args) throws Exception {
    Workspace workspace = new Workspace(
        "Spring PetClinic",
        "This is a C4 representation of the Spring PetClinic sample app
         (https://github.com/spring-projects/spring-petclinic/)");

    Model model = workspace.getModel();

}
```

```
// software systems and people
SoftwareSystem springPetClinic = model.addSoftwareSystem(
    "Spring PetClinic",
    "Allows employees to view and manage information regarding the
     veterinarians, the clients, and their pets.");

Person clinicEmployee = model.addPerson(
    "Clinic Employee", "An employee of the clinic");

clinicEmployee.uses(springPetClinic, "Uses");
```

```
// containers
Container webApplication = springPetClinic.addContainer(
    "Web Application",
    "Allows employees to view and manage information regarding the
     veterinarians, the clients, and their pets.",
    "Apache Tomcat 7.x");

Container relationalDatabase = springPetClinic.addContainer(
    "Relational Database",
    "Stores information regarding the veterinarians, the clients,
     and their pets.", "HSQLDB");

clinicEmployee.uses(webApplication,
    "Uses", “HTTP");

webApplication.uses(relationalDatabase,
    "Reads from and writes to", "JDBC, port 9001");
```

```java
// components
ComponentFinder componentFinder = new ComponentFinder(
    webApplication,
    "org.springframework.samples.petclinic",
    new SpringComponentFinderStrategy(
        new ReferencedTypesSupportingTypesStrategy()
    ),
    new SourceCodeComponentFinderStrategy(
        new File(sourceRoot, "/src/main/java/"), 150));

componentFinder.findComponents();
```

```
// connect components with other model elements
webApplication.getComponents().stream()
    .filter(c -> c.getTechnology().equals(SpringComponentFinderStrategy.SPRING_MVC_CONTROLLER))
    .forEach(c -> clinicEmployee.uses(c, "Uses", "HTTP"));

webApplication.getComponents().stream()
    .filter(c -> c.getTechnology().equals(SpringComponentFinderStrategy.SPRING_REPOSITORY))
    .forEach(c -> c.uses(relationalDatabase, "Reads from and writes to", "JDBC"));
```

```
// system context, container and component views
ViewSet viewSet = workspace.getViews();

SystemContextView contextView = viewSet.createContextView(
    springPetClinic, "context", "Context view for Spring PetClinic");
contextView.addAllSoftwareSystems();
contextView.addAllPeople();

ContainerView containerView = viewSet.createContainerView(
    springPetClinic, "containers", "Container view for Spring PetClinic");
containerView.addAllPeople();
containerView.addAllSoftwareSystems();
containerView.addAllContainers();

ComponentView componentView = viewSet.createComponentView(
    webApplication, "components", "Component view for the Spring PetClinic webapp.");
componentView.addAllComponents();
componentView.addAllPeople();
componentView.add(relationalDatabase);
```

You can create
many **visualisations**
from a single model

# Structurizr

Visualise, document and explore your software architecture

Create system context diagrams using Java code.

Extract components from your Java codebase, using static analysis and reflection.

Client-side encrypt your workspace for additional security ('password').

Create animated diagrams to describe dynamic behaviour.

Create enterprise context diagrams using code.

Document your software with Markdown and AsciiDoc, effortlessly embed diagrams.

Create diagrams using text with Structurizr Express.

Create diagrams using C# code.

Extract components from your .NET codebase, using static analysis and reflection.

Explore inbound, outbound and cyclic dependencies between components.

Explore component size.

Embed diagrams into Atlassian Confluence with prebuilt macros.

```
// upload the software architecture model to structurizr.com
StructurizrClient client = new StructurizrClient("key", "secret");
client.putWorkspace(1234, workspace);
```

```

**Owner**

Simple JavaBean domain object representing an owner.

org.springframework.samples.petclinic.model.Owner
[Code: 153 lines, shared]

# The **1990**’s called and they want their tools back!

It’s 2018 and we shouldn’t be using a general purpose diagramming tool for software architecture

# Abstractions first, notation second

Ensure that your team has a ubiquitous language to describe software architecture

# Thank you!
